

# SFTP Crawler Documentation

## Introduction

This document will explore how to setup the *SFTP* crawler.

## Prerequisites

In order to setup a the SFTP Crawler you will need the following credentials:

- Username
- Password
- Port number
- Hostname (IP Address)
- Root folder (Directory)

## Username & password

This relates to the username and password to the SFTP server you wish to crawl.

 A username OR email are possible valid entries here

## Port Number and Hostname

The host-name can either be a IP address or a FQDN. For instance, `test.simsage.ai`. You will also be asked to provide the port number. Usually this is 22 by default, but this may vary, especially if you or your company have changed this on set-up.

## Root Folder

You *must* provide the root folder you wish to crawl from, we crawl inclusively, meaning that sub-directories will be search from the root.
