[Server and Map-Server](#)

Introduction

In this document we will explain how to correctly setup the *ArcGIS* crawler.

Server and Map-Server

ArcGIS is a server first. A server in this case is the fully-qualified-domain-name (FQDN). This is basically the address of the server without the https:// or http:// parts and without the parts after the first slash. If the server URL is for instance

`https://sampleserver6.arcgisonline.com/arcgis/rest/services/USA/...` then the FQDN of that server is just the first part, in this example `sampleserver6.arcgisonline.com`.

The Map-Server is the part after `arcgis/rest/services/` in our example `USA`.

The HTTPS switch on the form is whether to use HTTP or HTTPS for communications. HTTPS is always preferred if available.

Edit Source: acr-test

General	ArcGIS Crawler	Metadata	ACLs	MimeTypes	Check Document	Schedule
	<p>ArcGIS server name *</p> <input type="text" value="sampleserver6.arcgisonline.com"/>					 ArcGIS Setup Guide
	<p>ArcGIS Map Server *</p> <input type="text" value="USA"/>			<input checked="" type="checkbox"/> use HTTPS		
						<input type="button" value="Close"/> <input type="button" value="Test"/> <input type="button" value="Reset Delta"/> <input type="button" value="Save"/>
